February 13, 2006

For Immediate Release
TSX Venture: "DTA"

**ATKINSON GOLD PROSPECT, LIPTON CLAIM GROUP
ABITIBI GREENSTONE BELT, 16 KM SOUTH OF DETOUR LAKE MINE
PORCUPINE MINING DIVISION, ONTARIO
2,000M CORE DRILL PROGRAM**

Due to ice conditions on the Detour River, the work permit issued by the Ministry of Natural Resources, Ontario, had to be amended, to allow for the construction of a second ice bridge ("temporary crossing") across the Detour River, such amendment has now been obtained.

It is anticipated that a core drill rig will be in place on the Lipton claim group on or about February 20, 2006, a delay of about 20 days. A camp has been erected on the north side of the Detour River.

The Lipton claims host significant gold mineralization, defined by a number of drill holes in 1996, grading better than 2.5 g/t, the best hole 10.7 g/t over 9m.

Additional geophysical surveys, the latest being Dentonia's ground magnetometer survey in April/May 2005, have defined targets to be explored by diamond drilling during the upcoming program. In particular, Dentonia's ground magnetometer survey, April/May 2005, mapped a deep seated magnetic feature, 60m below surface, to the northeast of the 1996 drill hole, (10.7 g/t), which will be tested during this proposed program. This mineralized zone is interpreted to be open down dip and along strike to the north-east.

Geophysical surveys, have also defined 11 targets, in addition to this gold zone, on the Lipton claims, which are to be explored by diamond drilling.

Due to its thick glacial overburden, the general area of the Atkinson Gold Prospect, in the past, had only low to moderate exploration density.

It should be noted that Falconbridge (formerly Noranda) staked claims to the east and adjacent to the Lipton claims. Falconbridge entered into a joint venture agreement with Eastmain Resources Inc., which is the operator of those claims, relying on the Mega TEM technology (airborne) developed by Falconbridge which allows for the detection of

polymetallic deposits, at depths of up to 240m, deeper than any other airborne method. For details, see Eastmain Resources Inc. "Annual Information Form", under the heading Mega TEM, dated January 27, 2006.

As a general observation, the Abitibi Greenstone Belt is one of the most prolific gold producing areas, only second to the Witwatersrand area, South African, in the world. Of the forty one (41) gold deposits worldwide, with production plus reserves of greater than 10 million ounces, five (5), namely, Hollinger-McIntyre, Kirkland Lake, Dome, Kerr Addison and Horne Mines are in the Abitibi Subprovince of the Superior Province. Two others, with lesser reserves, the Campbell Red Lake-Goldcorp and Hemlo Mines are also located within the Abitibi Greenstone Belt.

This program is being managed by Paul R. Nicholls, P. Eng., Ontario.
