For Immediate Release

## COLOUR GRADING OF THE DO27 DIAMONDS

Questions have arisen with respect to the largest diamond recovered from the 548 dry tones of kimberlite material, which was described as, “ a 7.11 carat, light brown, slightly distorted octahedral gem;”

Reference is made to a paper delivered at the PDA conference by Zia Hasan, president of The Canadian Gemological Association, in March 1993, to quote:

### “Colour Grading

Colour grading of finished diamonds is based on a scale where colourless gems have the most value, followed by their decrease in value with a gradual increase of colour tint. Diamonds also occur in various shades of the major colours: blue, green yellow, brown and red. These are called “fancies” and are graded according to a scheme involving hue, tone and saturation similar to other coloured stones. - - -.”

If the “7.11 carat” is a “fancy” stone, it could be very valuable. We simply have to wait for the results of the valuation of the diamonds recovered from DO27 to have that question answered.

The diamonds have been sent to WWW International Diamond Consultants Ltd. in Antwerp, Belgium, for valuation.

The Argyle Mine, Australia, is noted for its “fancy pinks”.
